How to Integrate Razorpay Payment Gateway on Your Website

A step-by-step guide to accepting online payments on your website using Razorpay — from account setup to going live.

Step 1: Create a Razorpay Account

1. Go to razorpay.com and sign up with a business email and phone number (OTP verification).
2. This gives you **instant Test Mode access** — you can start building and testing immediately, without waiting for approval.

Step 2: Complete KYC / Onboarding

To collect **real** payments, Razorpay needs to verify your business (this is mandatory for every merchant, not optional).

Fill in:
- **Business type**: Proprietorship, Partnership, LLP, Private Limited, etc.
- **Business PAN** and business category
- **Bank account details** for settlement (cancelled cheque or bank statement)
- **KYC documents**: business registration proof, GST certificate (if applicable), authorized signatory's PAN + Aadhaar, address proof

Before submitting, make sure your website has these live pages — Razorpay checks for them during review:
- Terms & Conditions
- Privacy Policy
- Refund & Cancellation Policy
- A working Contact Us page

Submit for activation. Typical review time: **2–4 business days** (can take longer if document details don't match across PAN/GST/bank account, or if the required policy pages are missing).

Step 3: Build and Test in Test Mode (while KYC is pending)

You don't have to wait for approval to start building — Test Mode simulates the full payment flow with no real money involved.

Use Razorpay's official test cards (find the current list under **Docs → Test Card Details**) — note that generic/placeholder card numbers often fail with errors like "card not eligible" or "international cards not supported," so always use the specific test cards listed for Indian domestic payments.

Step 4: Choose the Right Payment Product

Razorpay offers a few different ways to collect payments — pick based on what you actually need:

Product	Best for
Payment Links / Payment Pages	A shareable link/button for one-time or repeat manual payments. Supports fixed or customer-entered amounts, plus custom fields. Easiest to set up, no auto-charging.
Subscriptions	True auto-recurring billing (e.g., auto-charge weekly/monthly). Requires the customer's card to support tokenized recurring/e-mandate payments — not all cards qualify, which can cause friction.

For most small businesses collecting recurring or invoice-based payments, a Payment Page is simpler and more reliable than Subscriptions, since it doesn't depend on card-level recurring support, and customers get to review each payment before paying — which many B2B clients actually prefer over silent auto-debits.

Step 5: Create Your Payment Page

Go to **Payment Pages → Create Payment Page** and configure:

Page content:
- Logo, page title, short description
- Contact Us (email + phone)
- Link to your Terms & Conditions

Payment Details (the form fields):
- **Amount** — choose Fixed, or "Customer enters amount" if pricing varies. Set a Minimum Amount to avoid accidental low entries. (Amount is required by default — no separate toggle needed.)
- **Name / Company Name** — add as a required custom Input field, so every payment tells you who paid.
- **Invoice/Reference Number** — optional but useful for matching payments to specific invoices.
- Keep **Email** (for receipts) and optionally **Phone**.

Under **Page Settings**, set a **notification email** so you get alerted the moment someone pays.

Step 6: Test End-to-End

Open your published Test Mode link, fill in the form, and pay using a valid domestic test card. Confirm the payment shows up under **Transactions** with the correct amount and custom field data (e.g., company name).

Step 7: Go Live

Once KYC is approved, your account switches to **Live Mode**. Test Mode pages/links do **not** carry over automatically — recreate the same

Payment Page (same fields and settings) in Live Mode to get a real, working link.

Step 8: Add the Payment Button to Your Website

Take the live Payment Page link and add it as a button anywhere on your site (a pricing section, a dedicated "Make a Payment" section, or your invoice emails). No backend/server code is required for this — it's just a link.

Step 9: Settlements — When You Actually Get the Money

- Default settlement schedule for most merchants: **T+2 working days** for domestic payments (excludes Sundays/bank holidays).
- This is Razorpay's standard for essentially everyone — faster cycles (T+1, instant) are either a paid add-on or reserved for high-volume merchants over time.
- Check **Settlements** in the dashboard to confirm your linked bank account and see upcoming settlement dates.

Step 10: How to Verify a Payment Without Waiting for Settlement

Payment **confirmation** is instant — it has nothing to do with the 2-day settlement timeline (that's just when the money reaches your bank).

To check if someone paid, right away:
1. **Transactions** tab — shows "Captured" status within seconds of checkout.
2. **Payment Pages → your page → Payment Receipts** — lists all payments through that specific page.
3. Set a **notification email** on the page so you're alerted automatically, in real time, every time someone pays.

Quick Checklist

- [ ] Razorpay account created
- [ ] KYC documents submitted
- [ ] Terms, Privacy, and Refund policy pages live on your website
- [ ] Payment Page built and tested in Test Mode
- [ ] KYC approved → Live Mode active
- [ ] Payment Page recreated in Live Mode
- [ ] Payment button added to website
- [ ] Bank account confirmed under Settlements
- [ ] Notification email set up for real-time payment alerts
